EPSX user guide

Explore companies, manage your account, and get started with EPSX Pay and Admin.

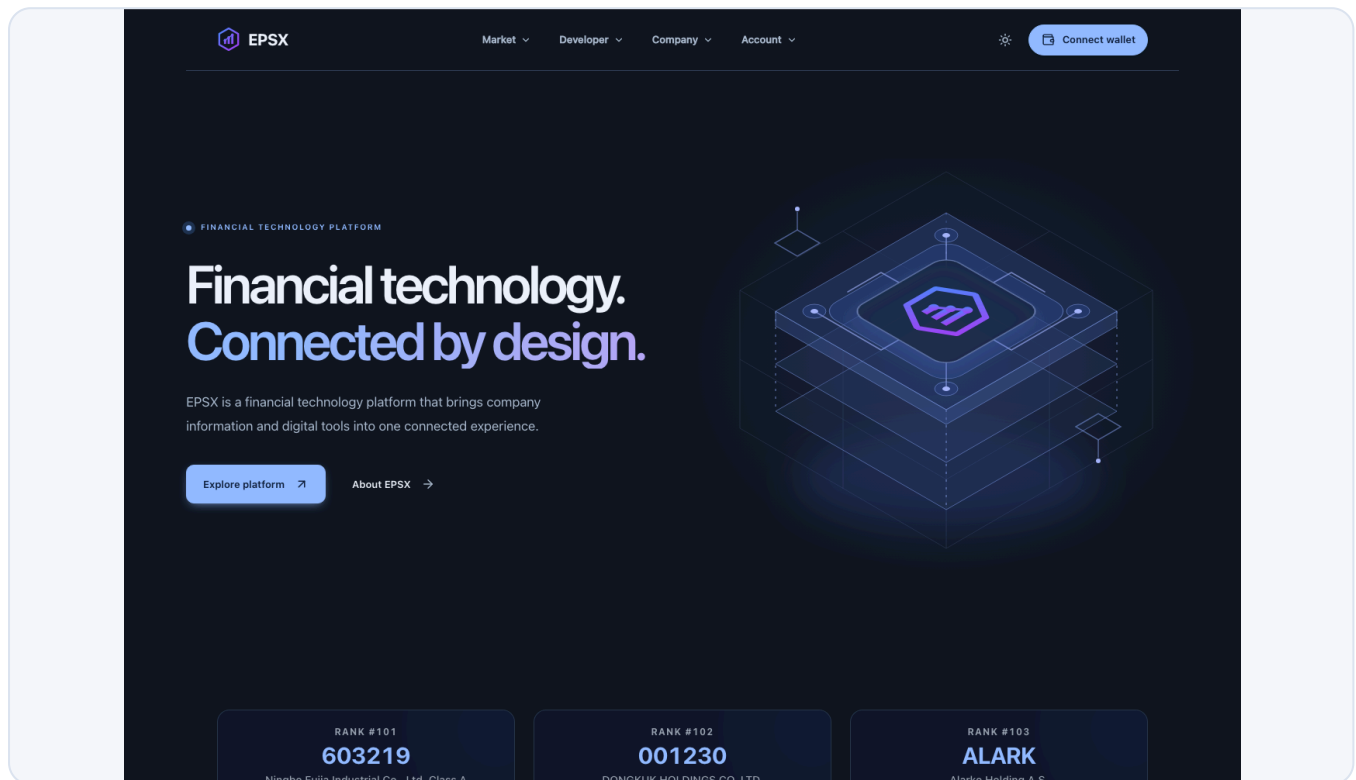

Figure 1 • EPSX home / localhost:3000

For users

Sign in with your wallet, explore company rankings, save companies, and compare plans.

For merchants and admins

Learn the main payment workflow, merchant menus, and access requirements for Admin.

Screenshots show the development system at the time of capture. Prices, results, and access can change. Check current details in the application.

Contents: Sign in 02 • Explore 03 • Stocks in detail 04-07 • Plans 08 • Account and API 09 • Admin 10 • Pay 11 • Merchant workspace 12 • Help and verification scope 13

01 / SIGN IN

Connect your wallet

Use the same wallet to return to your account and saved companies.

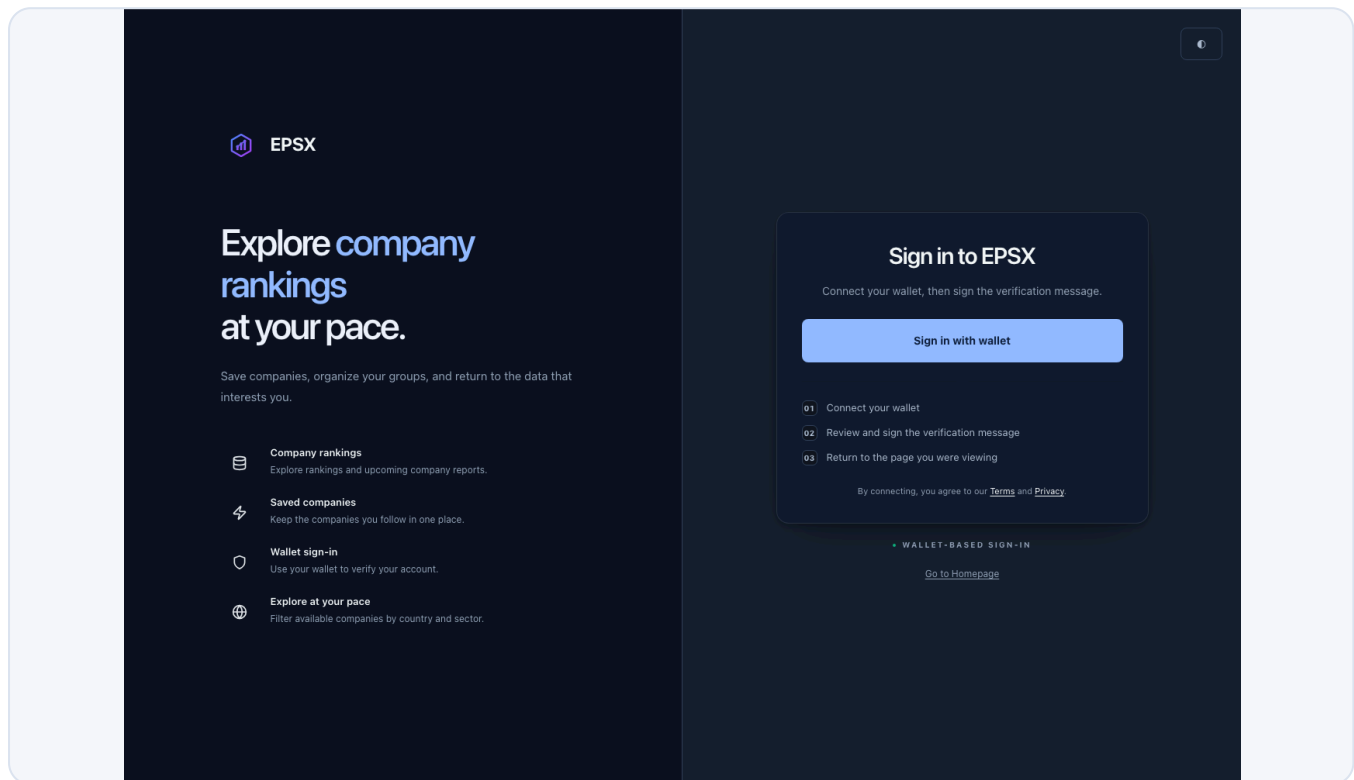

Figure 2 • /auth before connecting a wallet

1. Choose **Connect wallet** on the home page.
2. Select **Sign in with wallet** and choose the account in your wallet.
3. Review and sign the verification message.
4. After verification, the application returns to your requested page.

Opening Saved companies while signed out shows the sign-in page. Admin access also requires an authorized admin wallet.

A sign-in signature verifies your identity. Review any separate transaction request and its purpose before proceeding.

02 / EXPLORE

Explore and save companies

Open Market → Explore, or choose Explore platform on the home page.

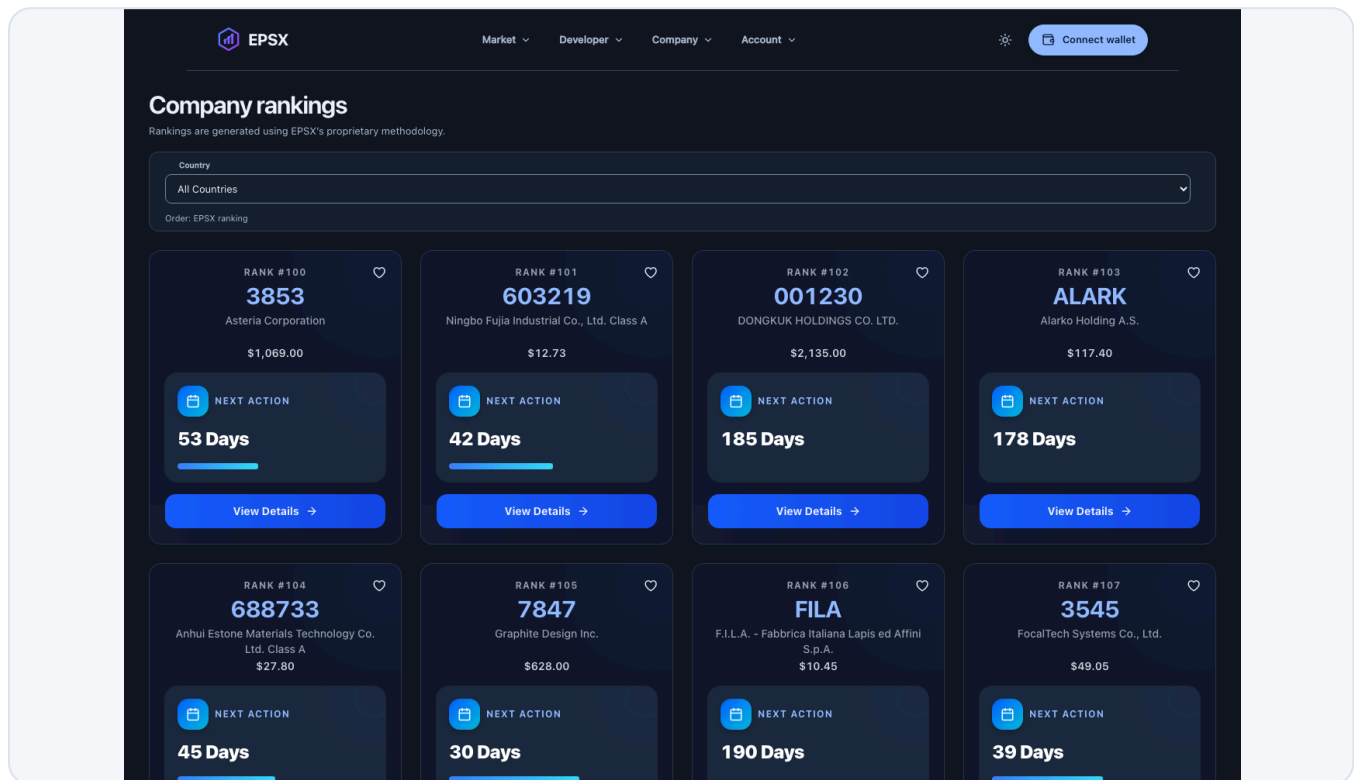

Figure 3 • Company rankings /analytics as a visitor

1. Choose a **Country** to filter the available results. If an **Update country** button appears, select it to apply the choice.
2. Read the company card: rank, symbol, name, price, and the displayed indicators.
3. Select **View Details** to open the linked TradingView page in a new tab.
4. After signing in, use the heart to save a company. Return through **Market** → **Saved companies**.

Your access determines which ranks and how many companies you can view. Results do not necessarily start at rank 1. Use Saved companies to organize your saved items.

02 / STOCKS IN DETAIL

Read a stock card

Check the company identity before opening more details.

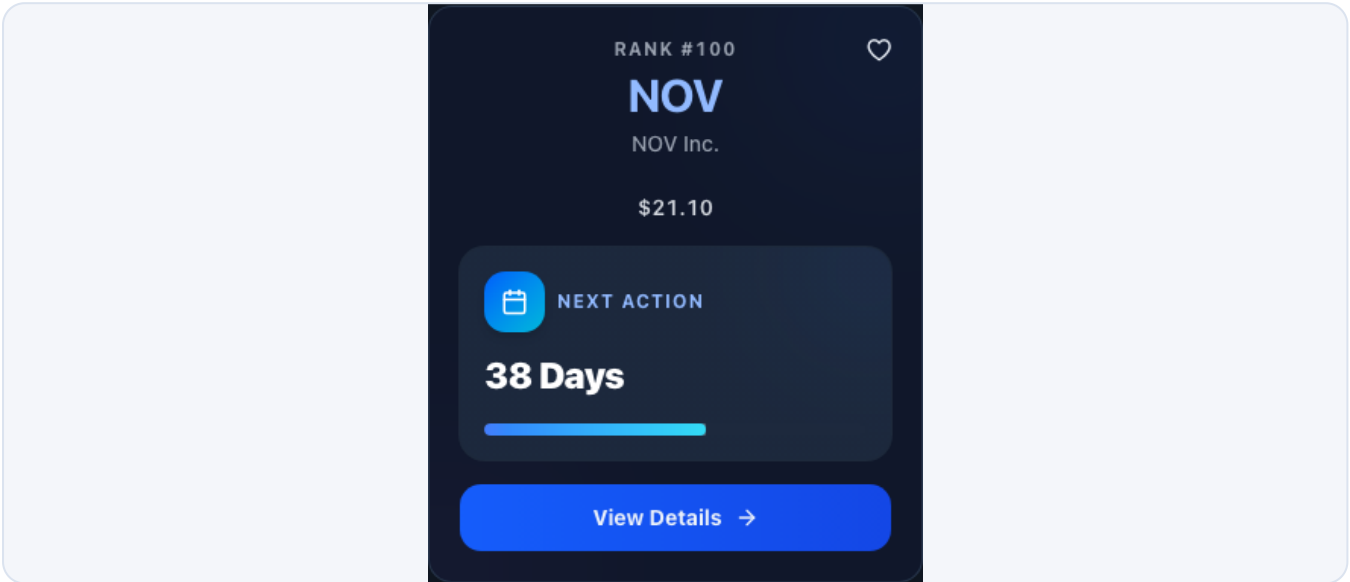

Figure 4 • Actual stock-card element after selecting United States

Item	How to read it
Rank	The position displayed by EPSX using its ranking methodology.
Symbol / name	The large ticker and the company name below it identify the company. Check both when symbols look similar.
Price	The value supplied to the card when the page loads. Check the displayed currency. The card does not show a last-price timestamp.
Heart / View Details	The heart saves a company. View Details links to TradingView in a new tab.

For further chart viewing, select View Details and confirm the company and exchange on the destination page. The current link includes the ticker without an exchange prefix.

02 / STOCKS IN DETAIL

Open details and save stocks

Use the actions on the company card to continue.

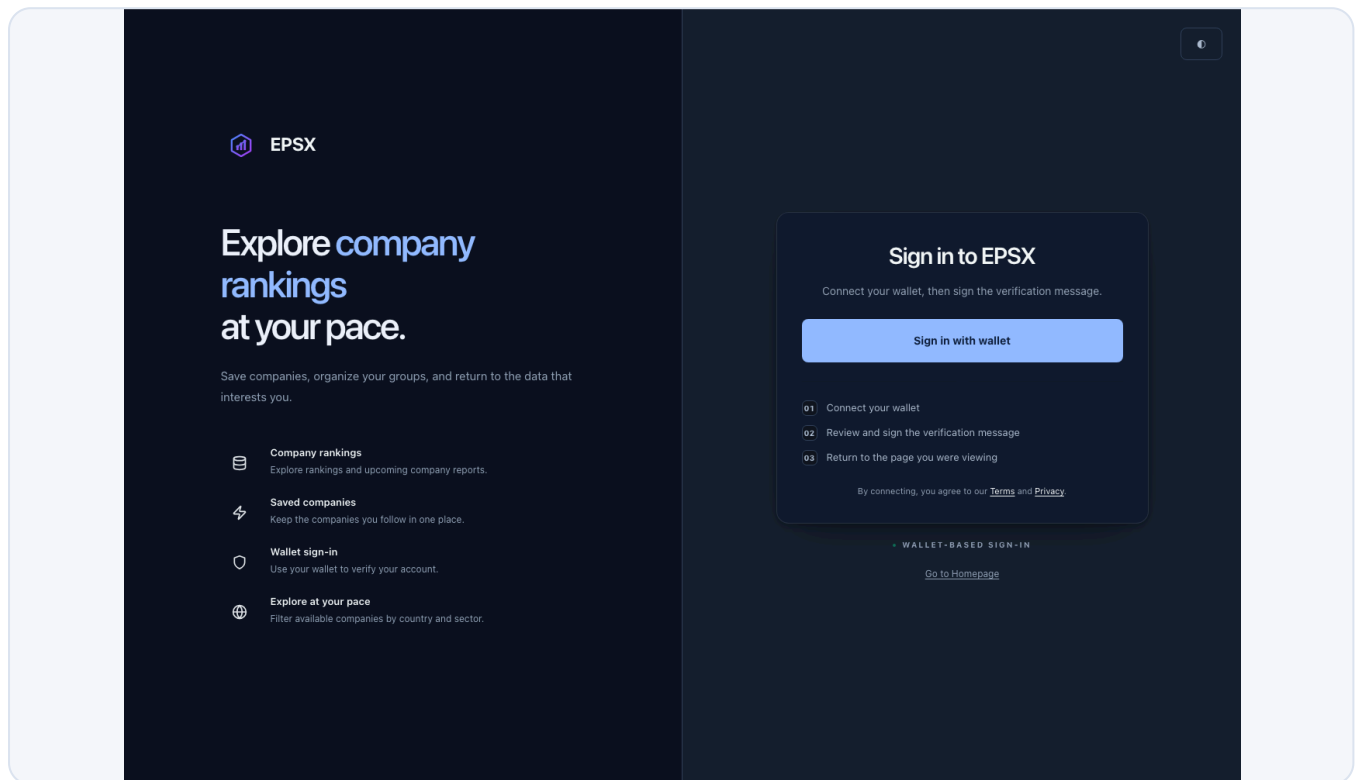

Figure 5 • Sign-in page opened by the heart action while signed out

Open further details

1. Check the symbol and company name on the card.
2. Select **View Details**. The link is configured to open TradingView in a new tab. Confirm the company and exchange there.
3. Return to the EPSX tab to compare another company.

Keep a company for later

Select the heart. If signed out, you will see the sign-in page shown above. After signing in, check whether the company is saved and save it if necessary. Open **Market** → **Saved companies** to revisit saved items.

We verified the visitor heart action opens sign-in with a return path to Analytics. We did not sign a message, write saved-company data, or verify TradingView page content.

02 / STOCKS IN DETAIL

Filter by country

Choose a market and inspect the refreshed results.

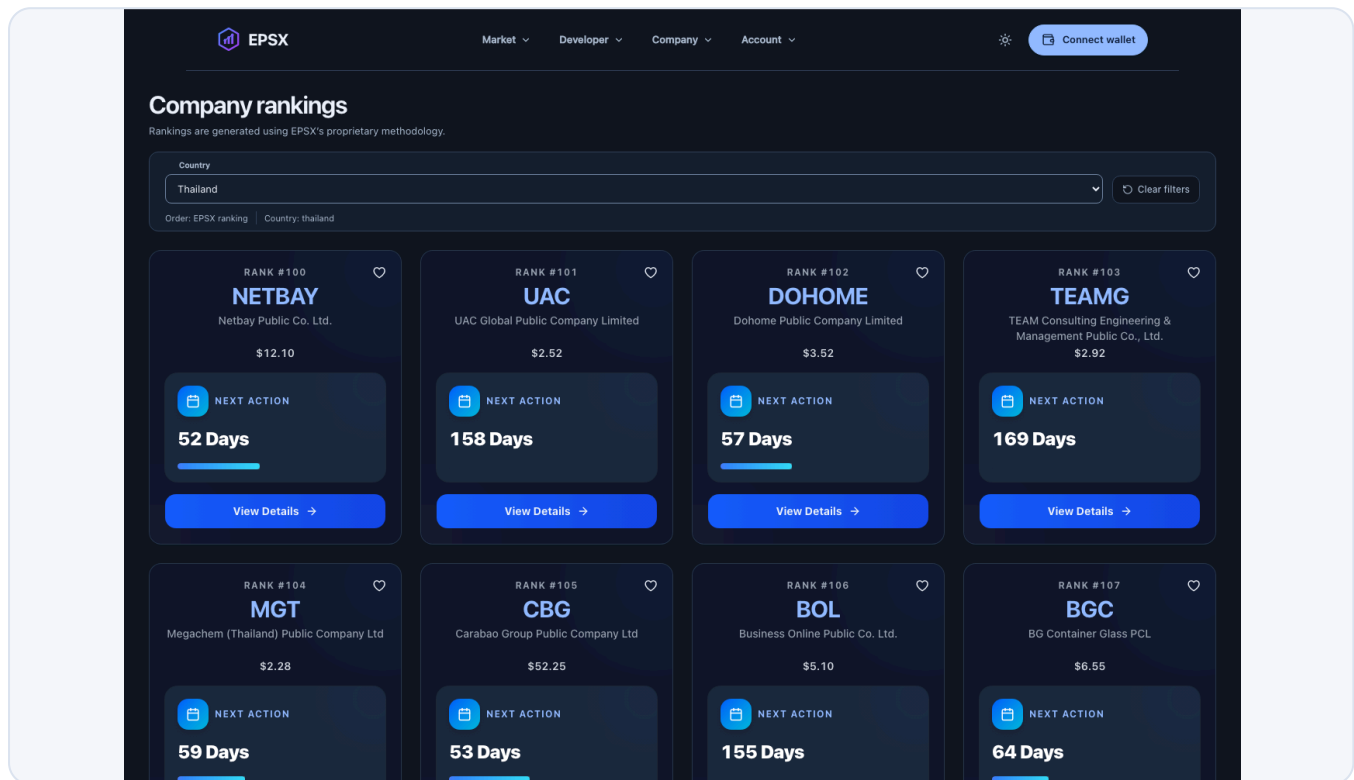

Figure 6 • Thailand selected in the updated application

1. Open **Market** → **Explore** and select the **Country** field.
2. Choose **Thailand** or another country. The ready interface updates automatically; use Update country if that button is shown.
3. Check that the selected country and company cards change. Changing the country starts at page 1.
4. Choose **All Countries** to return to the combined results.

Some countries have no results within your available rank range. This is different from a failed request. Review the access note below the results or select another country.

This interface shows Country and Order: EPSX ranking. No ticker-search field or Sector selector was present in the captured view.

02 / STOCKS IN DETAIL

Pages and accessible ranks

Scroll below the cards to inspect pagination and your access range.

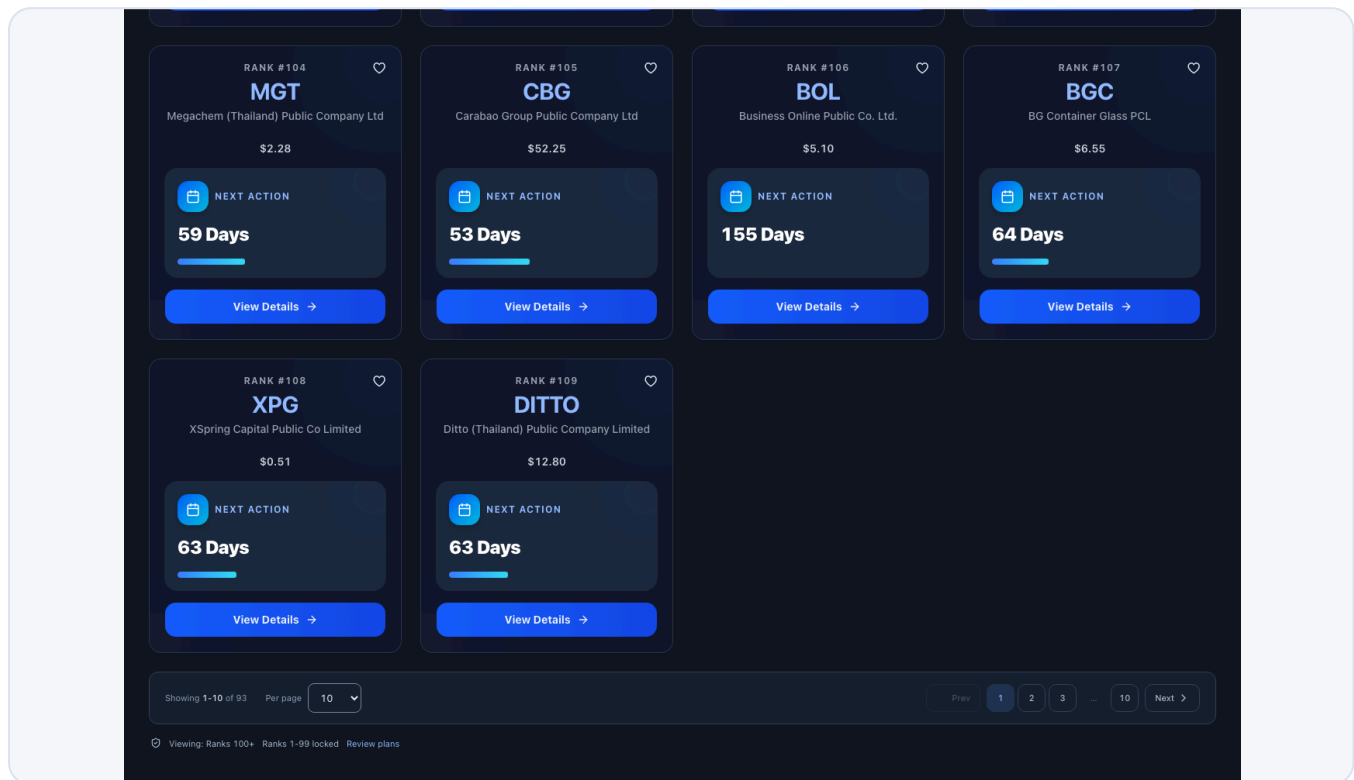

Figure 7 • Pagination and access note in a filtered view

1. **Showing** indicates the visible item positions and total available results. The numbers may change.
2. Use **Next** / **Prev** or a page number to move through the results.
3. Select **Per page** to adjust page size. The captured options are 10, 25, 50, and 100. Use Apply page size if shown.
4. Check **Viewing** and any locked-rank note. Choose **Review plans** to compare access options.

Showing positions and Rank are different. The first visible item can be rank 100 even when Showing starts at 1. Changing pages does not unlock ranks outside your access.

03 / PLANS

Compare plans and access

Open Market → Plans before starting a purchase.

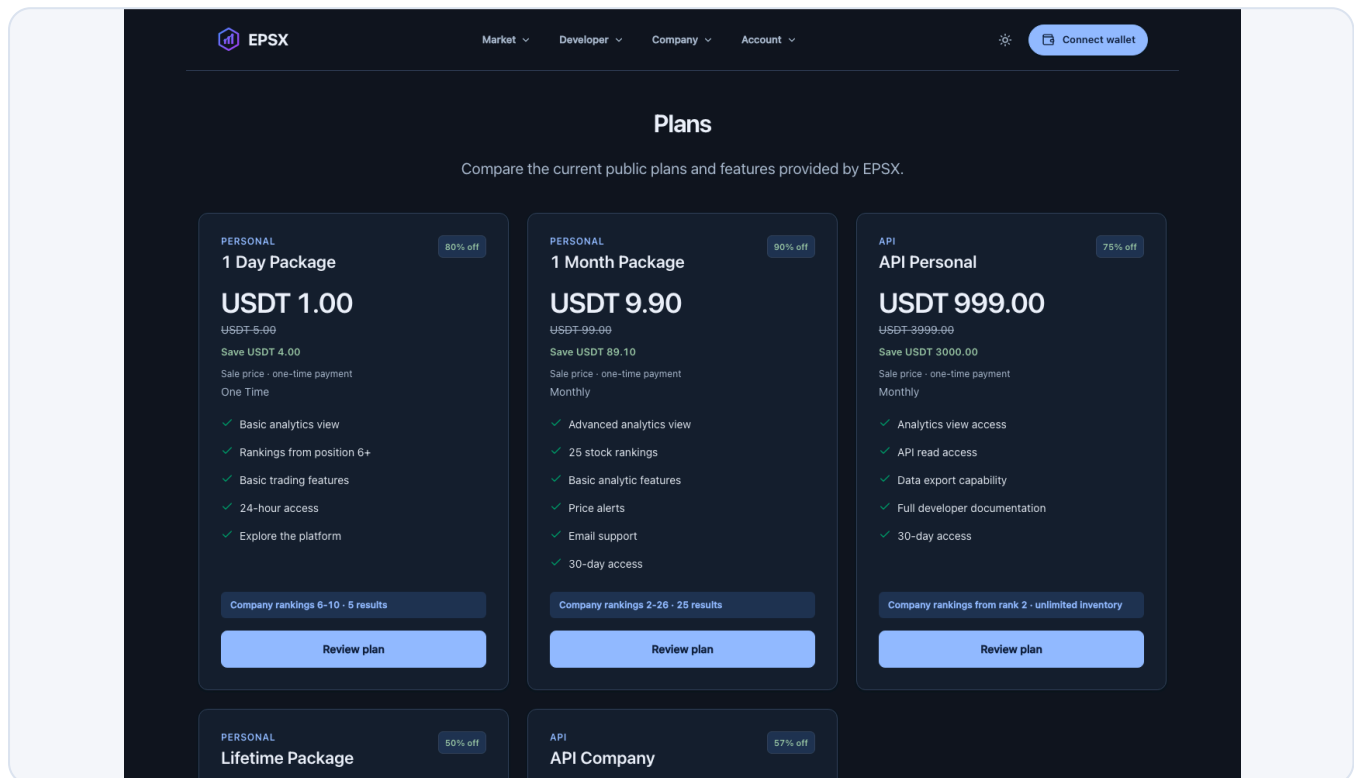

Figure 8 • /plans, showing part of the catalog

1. Compare the plan name, price, duration, and listed features.
2. Read the **Company rankings** line for its rank range and result allowance. Check API access if needed.
3. Select **Review plan**, then review the checkout details.
4. After completing a purchase, check **Account** → **Purchases** and **Account** → **Access**.

This screenshot explains the layout. Prices, promotions, and terms may change. If access does not appear after payment, check the existing order before trying again.

04 / ACCOUNT & DEVELOPER

Account and API tools

Use Account for personal settings and Developer for integration tools.

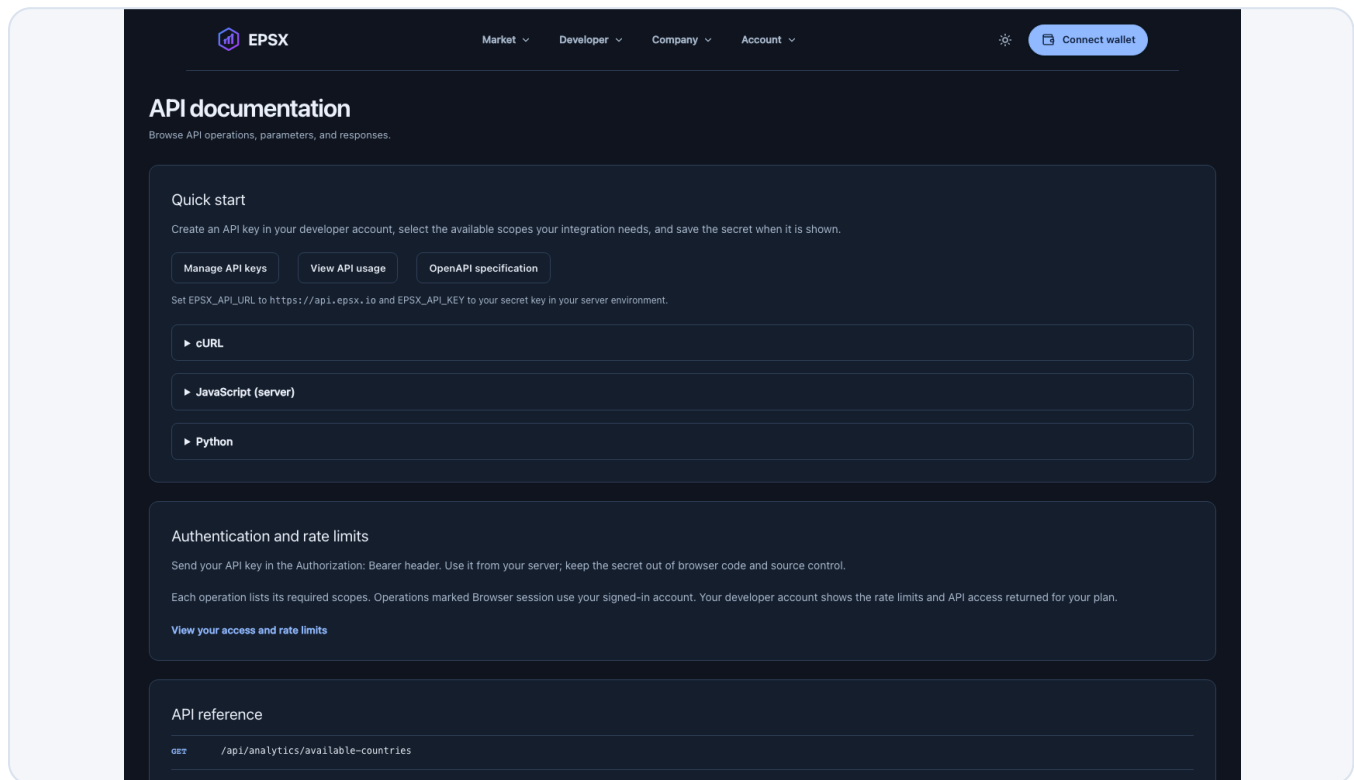

Figure 9 • /developer/docs

Common account menus

Profile / Settings: account details

Access: current permissions

Credits: account credits

Purchases: purchase history

Developer workflow

Use **API keys** to manage keys allowed by your access. Check **API usage** and read **API documentation** before integrating.

Save the API secret when shown and use it on your server. Each operation documents its required scopes. Browser-session operations require the appropriate signed-in session.

The screenshot is public documentation. Account data and key creation require sign-in and were not exercised for this guide.

05 / ADMIN

Start with Admin

Open the Admin site and use a wallet with administrator access.

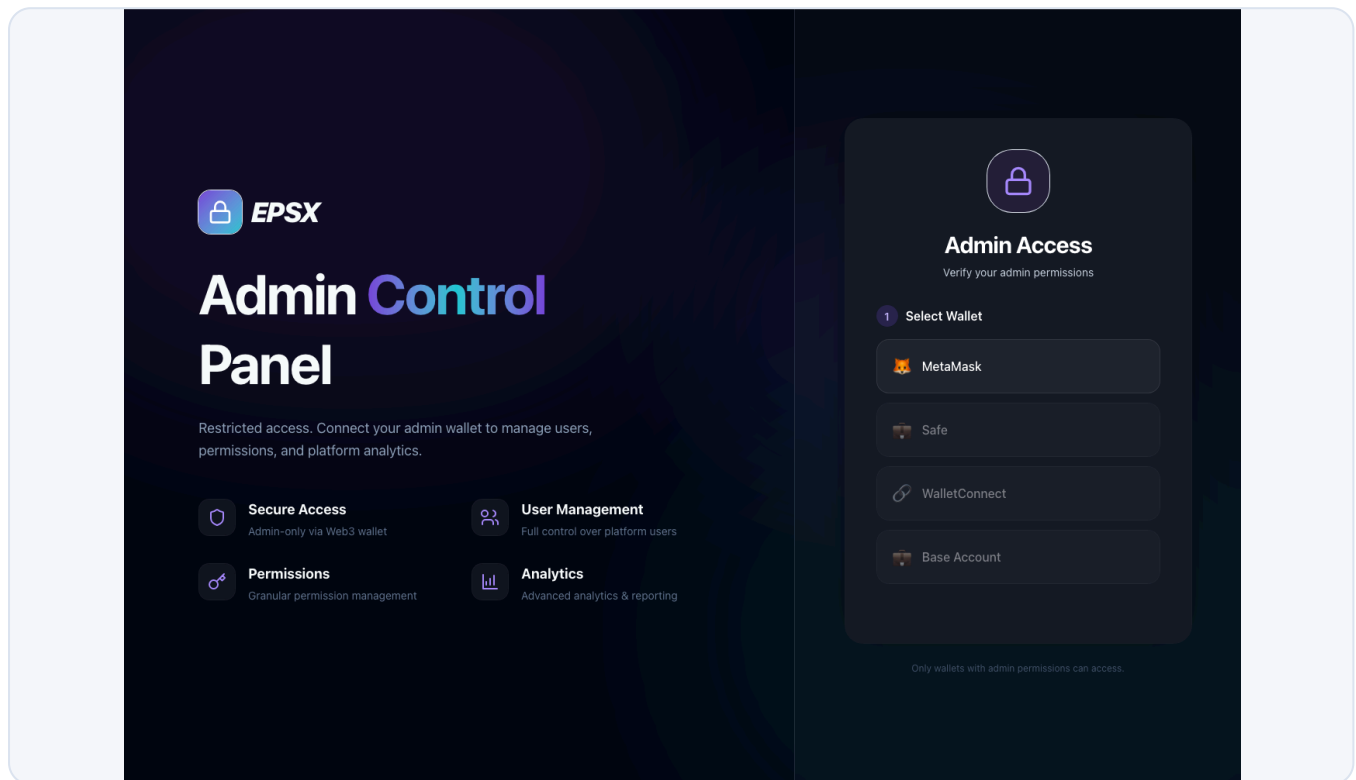

Figure 10 • localhost:3001/auth

1. Select a wallet on the Admin sign-in page.
2. Check the account and verification message before signing.
3. After authorization, open the menus available to your role.

Account administration

Wallet management contains wallet accounts, access, plans, and credits. Select the target account before reviewing details.

Platform administration

Routes include payments, Pay escrows, news, notifications, chat, developer tools, and audit logs, subject to access.

Only the sign-in screen was captured. Internal menu coverage is based on application routes; no admin records were accessed or edited.

06 / EPSX PAY

Meet EPSX Pay

A merchant workspace for payment links and hosted checkout.

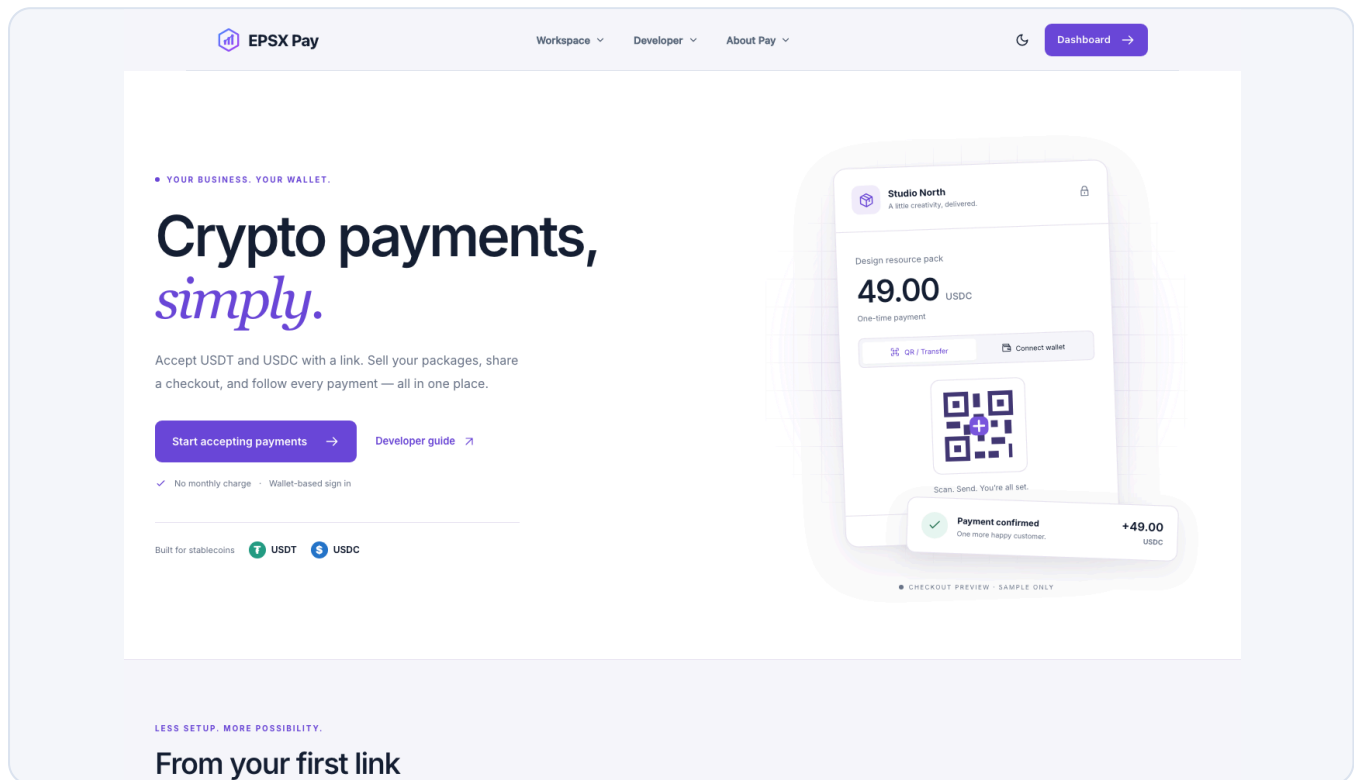

Figure 11 • EPSX Pay home / localhost:3002

1. Choose **Start accepting payments** or **Dashboard**.
2. Connect MetaMask, sign in, and follow the shop-name setup.
3. Create a package or payment link and share its checkout.
4. Track the outcome in **Payments** and review collection into the merchant wallet.

The checkout preview on the home page is labeled Sample only. It is not evidence of an actual payment. Keep Test and Live environments separate.

A shop is tied to its owner wallet and receiving wallet. Choose the intended wallet when starting.

07 / MERCHANT WORKSPACE

Main merchant workflows

Post-sign-in steps are based on the merchant guide and UI implementation.

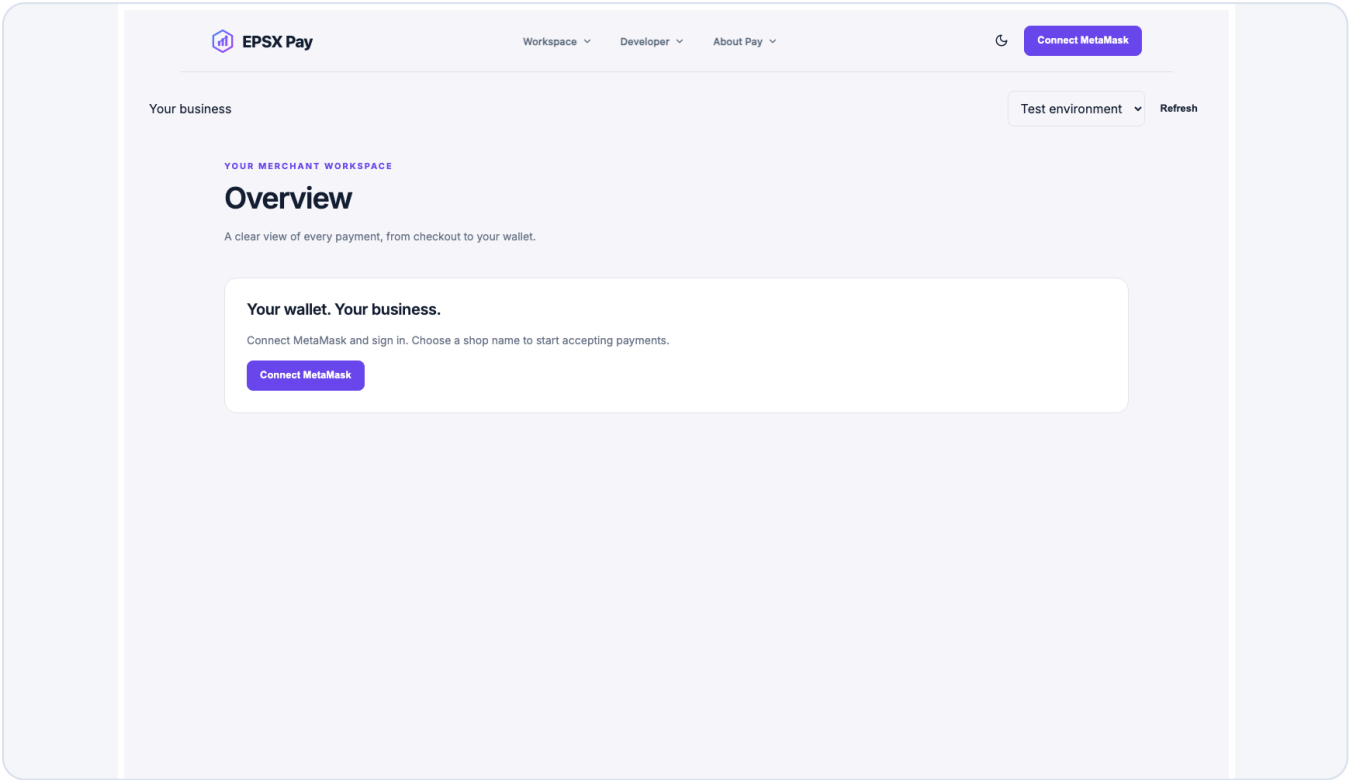

Figure 12 • Merchant Overview in Test environment before sign-in

Menu	Main action
Packages	Enter a name, terms, USDT/USDC prices, optional duration, and availability. Select Save package.
Payment links	Set Item name, Amount, Token, expiry, and optional usage limit. Select Create link, then Open link.
Payments	Open details and read Payment and Collection separately. Use collection or refund actions when available.
Settings / Webhooks	Update the shop name, manage server API keys, and configure HTTPS notification endpoints.

Check Test/Live first. Collection can require a signature and gas. Refunds require the necessary funds. No payment, collection, or refund was performed for this guide.

08 / QUICK HELP

Troubleshooting and scope

Check the following before contacting support.

Issue	What to check
Wallet will not connect	Open and unlock your wallet, check the selected account, and try sign-in again. Cancelling the signature leaves you signed out.
Returned to sign-in	Sign in again with the same wallet and reopen the requested menu.
Admin access denied	Check that the wallet has admin permissions. Connecting alone does not grant them.
No country results	Check Country and the available rank range. An empty accessible result is different from a service error. Try another country or clear the filter.
Payment not updated	Check Purchases or Payments and the selected environment. Keep the order reference and transaction hash for support.

Verification scope

The guide uses real development-browser screenshots: 12 images, with full views at 1440 × 1000 and one element capture. Country selection and the visitor heart action were exercised. Images were not fabricated or altered.

No wallet login, API-key creation, purchase, shop creation, payment, refund, or admin mutation was performed. Post-sign-in steps are guidance from the UI and project documentation.
